

Water Quality

Q: Recently I saw on the national news a problem with higher lead levels in some municipal water systems. Should I be testing my water or install some type of filter?

A: Testing may be recommended if there is a visual, odor or taste problem that wasn't there before. The question to really ponder: What is happening between the water treatment plant and your kitchen tap?

Water is described as “the universal solvent” and as a result of this solvent action water dissolves at least a portion of everything it touches. That includes heavy metals, rocks, dirt/dust, waste matter and other foreign substances. Testing water for a multitude of contaminants can cost several hundred to thousands of dollars and still not find a “sporadic” problem.

The best “insurance step” every homeowner or business can do is to have at least one cold water faucet equipped with a multi-contaminant cartridge filter system for cooking and drinking. This strategy gives you the consistent water quality 24/7. For more ideas on this topic or any of Water Werks “multi-service” capabilities give us a ring!
